FUTURE HARVEST CASA'S

CULTIVATE THE CHESAPEAKE FOODSHED

19TH ANNUAL CONFERENCE | JANUARY 11-13, 2018

COLLEGE PARK MARRIOTT • 3501 UNIVERSITY BLVD EAST • HYATTSVILLE, MD

More than 40 sessions and workshops showcasing the region's cream of the crop ag experts and latest information about farming and food

FEATURING

GABE BROWN
REGENERATIVE
RANCHER

MICHAEL TWITTY
CULINARY HISTORIAN

IRA WALLACE
AUTHOR, SEED SAVER,
EDUCATOR

Saving a National Treasure

Promoting rotational grazing

- “Before and after” scenarios for 8 farms
 - **Greenhouse Gases:** Comet-Farm & A-Microscale (ACR – GLLM methodology)
 - **Water Quality:** Chesapeake Bay Nutrient Trading Tool (modified version of NTT)
 - **Soil Health:** Cornell Soil Health Testing Lab
 - **Economics:** UMD Economist
- Leveraging the “Carbon Reduction Fund”
 - WGL Energy Carbon Offsets/Sterling Planet

| Group | Indicator | Value | Rating | Constraints |
|-------------------|--|-------|--------|---|
| <i>physical</i> | Surface Hardness | | | Not rated: No Field Penetrometer Readings Submitted |
| <i>physical</i> | Subsurface Hardness | | | Not rated: No Field Penetrometer Readings Submitted |
| <i>physical</i> | Aggregate Stability | 11.4 | 10 | Aeration, Infiltration, Rooting, Crusting, Sealing, Erosion, Runoff |
| <i>biological</i> | Organic Matter | 2.5 | 5 | Nutrient and Energy Storage, Ion Exchange, C Sequestration, Water Retention |
| <i>biological</i> | Soil Respiration | 0.5 | 35 | |
| <i>chemical</i> | Soil pH | 6.7 | 100 | |
| <i>chemical</i> | Extractable Phosphorus | 48.2 | 9 | High Phosphorus, Environmental Impact Risk |
| <i>chemical</i> | Extractable Potassium | 291.4 | 100 | |
| <i>chemical</i> | Minor Elements Mg: 176.1 / Fe: 1.9 / Mn: 16.0 / Zn: 1.6 | | 100 | |

Overall Quality Score: **51** / Medium

Case Study Farm 1

- 198 acre dairy farm in PA
- Baseline:
 - 90 acres in cropland – alfalfa, corn, rye
 - 37 acres rotational grazing/pasture
 - Use of manure and fertilizer on all fields
- Project:
 - 40 acres in cropland
 - 87 acres in rotational grazing
 - No commercial fertilizer

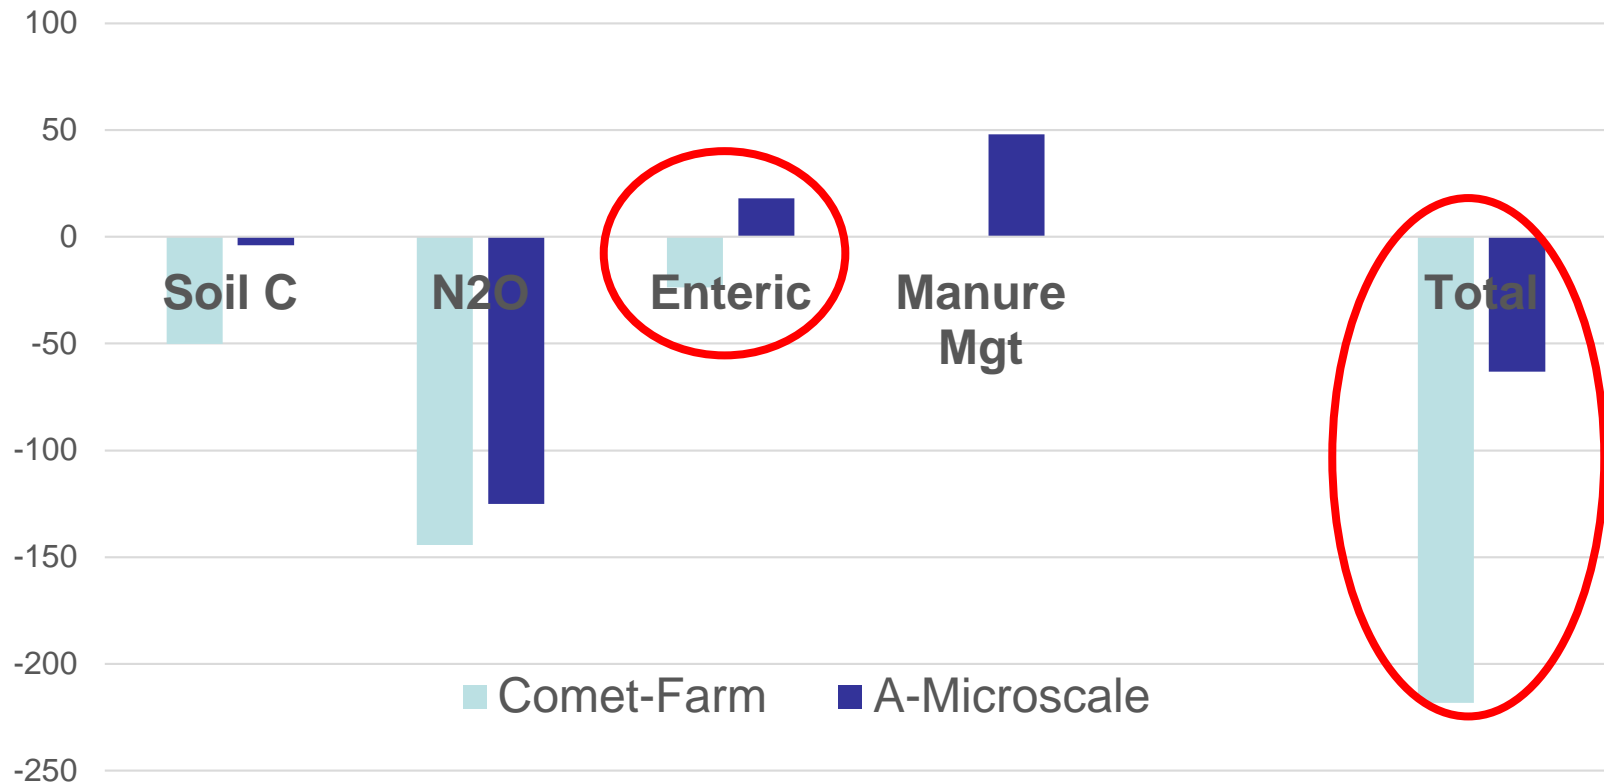

Case Study Farm 1

- 100 milking cows, 96 in project scenario; roughly 22 dry cows and 50 calves
- Diet transition to more grass, less grain/corn.
- Manure handling: slurry pit; then slurry pit and dry stacking in project scenario.
- Milk production increased in project scenario

How do GHG model results compare?

Emissions changes between baseline and project scenario (tonnes CO2 eq/yr)

Closing thoughts...

- Sensitivity analysis of model inputs (even qualitative) would be useful, especially around diet choices
- Explanation of differences in enteric emissions estimates between Comet-Farm and A-Microscale worth exploring
- Comet-Farm inputs very similar to CB-NTT. Assumptions well documented, though not readily available. Field scale info is insightful. Ability to save different scenarios would be useful.
- A-Microscale is somewhat less data intensive, but a little clunky. Results relatively consistent with Comet-Farm.
- Obvious trade-off of simplicity vs complexity
